

mongoDB[®]

Bigdata Lab 7

MongoDB

Before Index

- What does database normally do when we query?
 - MongoDB must scan **every** document.
 - Inefficient because process **large volume** of data

```
db.users.find( { score: { "$lt" : 30 } } )
```

Definition of Index

Definition

- Indexes are special data structures that store a small portion of the **collection**'s data set in an easy to traverse form.

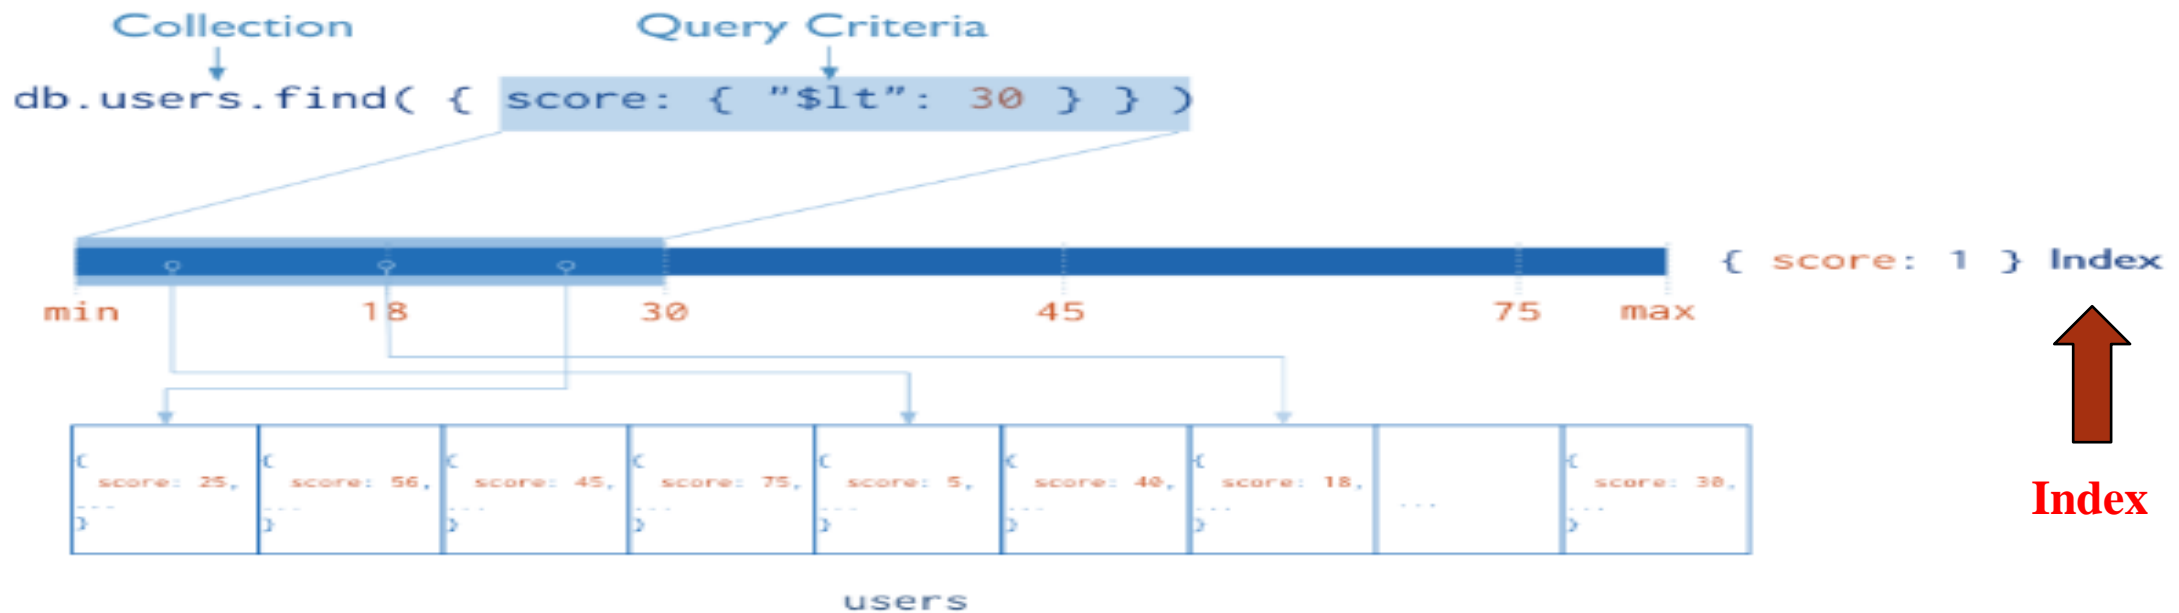

Diagram of a query that uses an index to select

Index in MongoDB

Operations

➤ Creation index

➤ `db.users.ensureIndex({ score: 1 })`

`db.collection.ensureIndex({field :  })`

➤ By default each created collections mongo create an index base on **_id** and sorted ascending.

➤ Show existing indexes

➤ `db.users.getIndexes()`

➤ Drop index

➤ `db.users.dropIndex({score: 1})`

Index in MongoDB

➤ Explain—Explain

➤ `db.users.find().explain()`

➤ Returns a document that **describes the process and indexes and ensure that the find() function used the index in the query.**

➤ Hint

➤ `db.users.find().hint({score: 1})`

➤ Override MongoDB's **default index selection**

Example Query: find the keyword
'MongoDB'

Without
database index

Scan each row one by
one to find the 654th
keyword

Keyword ID	Keyword name
1	
2	
3	
.	
.	
.	
654	MongoDB
.	
.	
.	
.	
.	
1000	

Block A

Scan the last row of Block
A, let's say the first letter is
L, so M must be in Block B

With database
index

Block B

Number of scans
significantly reduced

Block C

Indexing Properties in MongoDB

➤ **background: Boolean**

- Builds the index in the background.(default: false)

➤ **unique: Boolean**

- Reject duplicate values in the index field.(Default: false)

➤ **name: String**

- Change the index name.(Default : attributeName:1 Or -1)

➤ **sparse: Boolean**

- Skip any document that miss the index key

➤ **expireAfterSeconds:**

Index in MongoDB

- **Types of Indices:**
 - Single Field Indexes
 - Compound Field Indexes
 - Multikey Indexes

Single Field Index

➡ `db.users.ensureIndex({ score: 1 })`

Diagram of an index on the score field (ascending).

Compound Field index

➡ `db.users.ensureIndex({ userid:1, score: -1 })`

Diagram of a compound index on the `userid` field (ascending) and the `score` field (descending). The index sorts first by the `userid` field and then by the `score` field.

Multi-Key index

➡ `db.users.ensureIndex({ addr.zip:1})`

collection

```
{
  userid: "xyz",
  addr: [
    { zip: "10036", ... },
    { zip: "94301", ... }
  ],
  ...
}
```

`{ "addr.zip": 1 } Index`

Diagram of a multikey index on the `addr.zip` field. The `addr` field contains an array of address documents. The address documents contain the `zip` field.

Let's try

Go to commands file

Thanks
